Healthcare's Tit-for-Tat Quality Model

The diagram illustrates the increasing complexity of healthcare quality requirements over time, represented by a staircase structure. The years 1980, 1990, 2000, 2010, and 2020 are marked on the steps. The top step (1980) is labeled 'Money and Manpower Available for Patient Care and Investing in Future Growth'. The bottom step (2020) is labeled 'to create the perception of action'. The left side of the staircase lists requirements: Rules, Regulations, Reporting Requirements, Accreditation Standards, and Billing & Payment Prerequisites. The right side lists requirements: Forms, Committees, Wasteful steps in procedures, Educational Activities, and More than a dozen other forms of soft quality activities. A hand is shown dropping coins on the right side of the diagram.

Antibiotic Stewardship!

- Leaders establish antimicrobial stewardship as an organizational priority.
- The hospital educates staff and licensed independent practitioners involved in antimicrobial ordering, dispensing, administration, and monitoring about antimicrobial resistance of initial

Antibiotic Stewardship!

- The hospital program.
- The antibiotic stewardship program monitors the hospital's antibiotic use by analyzing data on days of treatment need, after 48 hours).
- The antibiotic stewardship program includes the following core elements:

Antibiotic Stewardship!

- The governing body appoints a physician and/or pharmacist who is qualified through education, training, or experience in infectious diseases and/or antibiotic stewardship as the leader(s) of the antibiotic stewardship program.
- The antibiotic stewardship program demonstrates coordination among all components of the hospital responsible for antibiotic use and resistance, including, but not limited to, the infection prevention and control program, the quality assessment and performance improvement program, the medical staff, nursing services, and pharmacy services.
- The antibiotic stewardship program implements one or both of the following strategies to optimize antibiotic prescribing:
 - Preauthorization for specific antibiotics that includes an internal review and approval process prior to use
 - Prospective review and feedback regarding antibiotic prescribing practices, including the treatment
- The antibiotic stewardship program evaluates adherence (including antibiotic selection and duration of therapy, where applicable) to at least one of the evidence-based guidelines the hospital implements. Note 1: The hospital may measure adherence at the group level (that is, departmental, unit, clinician subgroup) or at the individual prescriber level. Note 2: The hospital may obtain adherence data for a sample of patients from relevant clinical areas by analyzing electronic health records or by conducting chart reviews.

What Can An Incident Managed to the "100" Cost

1. Allocate one hour of time out of the bucket for future growth and into the buckets for fixing the past for the employee who has to spend as much as an hour of time manually completing and submitting the incident report.
2. Move another ten hours of time for the individual who has to initially investigate and manage the event. This is commonly the risk manager who has to receive it, log it, initially investigate it, orchestrate all future reviews and manage its closure.
3. Add on six hours of time into the bucket for fixing the past for the frontline manager that has to be involved in investigating it, talking to unhappy patients and their families and addressing what went wrong.
4. Add three hours of leadership costs for the discussions and involvement of every operational leader that was impacted by the investigation.
5. Add three hours of physician costs for every physician involved if the incident includes a physician-related error.
6. Add one hour of staff time if the incident has to be reported to a regulatory agency.
7. Triple the risk manager costs if the incident involves patient harm or an investigation by an outside agency.
8. Quadruple leadership and physician costs if the error results in long term or permanent harm.
9. If the event requires the creation of a formal corrective action plan for an outside agency that requires long term tracking, they can add in a cost factor of three hours for every quality professional involved and five for each operational and tactical leader for every month they have to manage the plan.
10. The leaders can then add ten to thirty hours of time for the marketing staff if the story associated with the event is negative and becomes public.
11. Triple all costs to this point if the event threatens Medicare certification or a payer relationship.
12. Add the costs for the time of every member of every committee involved in the review of the activity for every time it is reviewed, including prep time.
13. If the incident resulted in additional care because of a change in the patient's plan of care, add in those costs associated with having absorb the cost of that additional care because a DRG and "Never Events" obligation.
14. If the risk requires the notification of other patients because of an exposure and some form of mass testing or treatment, add in those costs.
15. If the incident is a potentially compensable event (an event that could result in a lawsuit), add in the possible costs associated with managing the claim and all related claims for a period of three to seven years (depending on venue) and its (their) potential direct losses.
16. Add in the costs associated with disciplinary or privilege-related actions that are part of the corrective action plan for a professional staff member.

✓ Saving Health Care

Non-Clinical Costs Associate with “100”!

- Claim denials that are on the rise and estimated to be costing the average hospital more than 5% of their potential earnings.
- \$40,000 to \$51,700 comes straight off the bottom line every time a hospital loses a nurse.
- A \$270,000 loss or more is created every time a turnover rate grows by 1%.
- Costs accumulate as it is estimated that 17% of new nurses quitting within 1 year of hire and 33% quitting within 2 years of hire.
- Then there is the \$7 million (+) in loss every time there is a successful cybersecurity attack.
- EHR costs, initial software and infrastructure costs, annual maintenance, additional licenses, upgrade fees, and support costs - including staff FTEs dedicated to the application.

✓ Saving Health Care

What does it mean to be in the 95th percentile on a question where the herd is running tight and its collective performance is only 67%.

What do it mean if that question that has nothing to do with what decides whether a patient feels so well cared for and personally cared about that he or she will be back with family and friends in tow because of the great stories they have to tell?
